Valorant Fantasy Team

Topic and Purpose

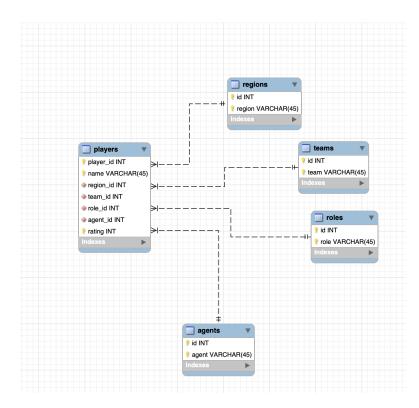

• I wanted to create a website where a user could browse professional Valorant players and add them to a fantasy team. I am a huge eSports fan (currently eBoard on the Valornat team) so building a website with this functionality was quite intriguing to me.

Instructions

- The credentials used are mine, so everyone has access to full CRUD functionality on the database.
- Use **draft** page to **add** players to your fantasy team.
- User **team** page to view your fantasy team
 - you can also **delete** players from your team, but only the last player added (due to limitations on javascript arrays)
- User database page to add, edit, and delete players from the database

Data

• while I have extensive knowledge of professional Valorant players, the ~150 entries are taken directly from https://www.vlr.gg/rankings where I manually inputted them into my custom database

Extras

1. Event-Driven DOM Manipulation

- a. The fantasy team can be added to and deleted from using DOM manipulation
 - i. mainly using javascript and local storage

2. Pagination

a. entries on the draft page are organized using pagination, as displaying 150 players all at once would be quite hard to sift through

3. Responsive Web Design

- a. each major element in the website scales based on screen size
- b. tables scale using bootstrap default breakpoints

4. Search Function (maybe)

- a. working search function on the database page
- b. allows user to search by player name (allows for efficient editing)

CSS Frameworks

- mostly bootstrap for major elements including:
 - o navbar
 - o tables
 - o forms
